Contents

1 An Introduction to Anatomy and Physiology 31

An Introduction to Studying the Human Body 32

- 1-1** All living things display responsiveness, growth, reproduction, movement, and metabolism 32
- 1-2** Anatomy is structure, and physiology is function 33
Anatomy • Physiology
- 1-3** Levels of organization progress from atoms and molecules to a complete organism 34
- 1-4** The human body consists of 11 organ systems 36
- 1-5** Homeostasis is the state of internal balance 36
- 1-6** Negative feedback opposes variations from normal, whereas positive feedback exaggerates them 40
Negative Feedback • Positive Feedback
- 1-7** Anatomical terms describe body regions, anatomical positions and directions, and body sections 43
Surface Anatomy • Sectional Anatomy
- 1-8** Body cavities of the trunk protect internal organs and allow them to change shape 45
The Thoracic Cavity • The Abdominopelvic Cavity

SPOTLIGHT

Levels of Organization 35

CLINICAL NOTES

Homeostasis and Disease 36

Imaging Techniques 50

Chapter Review 52

2 The Chemical Level of Organization 55

An Introduction to the Chemical Level of Organization 56

- 2-1** Atoms are the basic particles of matter 56
Atomic Structure • Isotopes • Atomic Weight • Electron Shells
- 2-2** Chemical bonds are forces formed by interactions between atoms 58
Ionic Bonds • Covalent Bonds • Hydrogen Bonds
- 2-3** Decomposition, synthesis, and exchange reactions are important chemical reactions in physiology 61
Basic Energy Concepts • Types of Reactions • Reversible Reactions

- 2-4** Enzymes catalyze specific biochemical reactions by lowering a reaction's activation energy 64
- 2-5** Inorganic compounds usually lack carbon, and organic compounds always contain carbon 64
- 2-6** Physiological systems depend on water 65
- 2-7** Body fluid pH is vital for homeostasis 66
- 2-8** Acids, bases, and salts have important physiological roles 67
Salts • Buffers and pH
- 2-9** Carbohydrates contain carbon, hydrogen, and oxygen in a 1:2:1 ratio 68
Monosaccharides • Disaccharides and Polysaccharides
- 2-10** Lipids contain a carbon-to-hydrogen ratio of 1:2 70
Fatty Acids • Fats • Steroids • Phospholipids
- 2-11** Proteins contain carbon, hydrogen, oxygen, and nitrogen and are formed from amino acids 73
Protein Function • Protein Structure • Enzyme Function
- 2-12** DNA and RNA are nucleic acids 76
Structure of Nucleic Acids
- 2-13** ATP is a high-energy compound used by cells 78
- 2-14** Chemicals form functional units called cells 80

SPOTLIGHT

Chemical Notation 62

CLINICAL NOTE

Too Sweet on Sugar? 71

Chapter Review 81

3 Cell Structure and Function 85

An Introduction to Cell Structure and Function 86

- 3-1** The study of cells provides the foundation for understanding human physiology 86
The Study of Cells • An Overview of Cell Anatomy
- 3-2** The plasma membrane separates the cell from its surrounding environment and performs various functions 87
Membrane Lipids • Membrane Proteins • Membrane Carbohydrates
- 3-3** Diffusion is a passive transport process that assists membrane passage 91
Diffusion

- 3-4 Carrier-mediated and vesicular transport processes assist membrane passage** 95
Carrier-Mediated Transport • Vesicular Transport
- 3-5 Organelles within the cytoplasm perform specific functions** 99
The Cytosol • The Organelles
- 3-6 The nucleus contains DNA and enzymes essential for controlling cellular activities** 106
Nuclear Structure and Contents • Information Storage in the Nucleus
- 3-7 DNA controls protein synthesis, cell structure, and cell function** 108
Transcription • Translation
- 3-8 Stages of a cell's life cycle include interphase, mitosis, and cytokinesis** 111
Interphase • Mitosis • Cytokinesis
- 3-9 Tumors and cancers are characterized by abnormal cell growth and division** 114
- 3-10 Cellular differentiation is cellular specialization as a result of gene activation or repression** 115

SPOTLIGHT

- Anatomy of a Model Cell 88
- Protein Synthesis, Processing, and Packaging 104

CLINICAL NOTES

- Inheritable Mitochondrial Disorders 103
- DNA Fingerprinting 108
- Mutations and Mosaicism 112

Chapter Review 116

4 The Tissue Level of Organization 120

An Introduction to the Tissue Level of Organization 121

- 4-1 The four tissue types are epithelial, connective, muscle, and nervous** 121
- 4-2 Epithelial tissue covers body surfaces, lines cavities and tubular structures, and serves essential functions** 121
Functions of Epithelia • Intercellular Connections • The Epithelial Surface • The Basement Membrane • Epithelial Renewal and Repair
- 4-3 Cell shape and number of layers determine the classification of epithelia** 125
Cell Layers • Cell Shapes • Classification of Epithelia • Glandular Epithelia
- 4-4 Connective tissue provides a protective structural framework for other tissue types** 131
Connective Tissue Proper • Types of Connective Tissue Proper • Fluid Connective Tissues • Supporting Connective Tissues

- 4-5 Tissue membranes are physical barriers of four types: mucous, serous, cutaneous, and synovial** 140
Mucous Membranes • Serous Membranes • The Cutaneous Membrane • Synovial Membranes
- 4-6 The three types of muscle tissue are skeletal, cardiac, and smooth** 141
Skeletal Muscle Tissue • Cardiac Muscle Tissue • Smooth Muscle Tissue
- 4-7 Nervous tissue responds to stimuli and propagates electrical impulses throughout the body** 143
- 4-8 The response to tissue injury involves inflammation and regeneration** 144
- 4-9 With advancing age, tissue repair declines and cancer rates increase** 145
Aging and Tissue Structure • Aging and Cancer Rates

SPOTLIGHT

- Inflammation and Regeneration 146

CLINICAL NOTES

- Exfoliative Cytology 131
- Marfan Syndrome 134
- Adipose Tissue and Weight Control 136
- Cartilages and Joint Injuries 137

Chapter Review 147

5 The Integumentary System 151

An Introduction to the Integumentary System 152

- 5-1 The epidermis is composed of strata (layers) with various functions** 153
Stratum Basale • Intermediate Strata • Stratum Corneum
- 5-2 Epidermal pigmentation and dermal circulation influence skin color** 156
The Role of Pigmentation • The Role of Dermal Circulation
- 5-3 Sunlight has beneficial and detrimental effects on the skin** 157
The Epidermis and Vitamin D₃ • Skin Cancers
- 5-4 The dermis is the tissue layer that supports the epidermis** 158
- 5-5 The subcutaneous layer connects the dermis to underlying tissues** 159
- 5-6 Hair is composed of dead, keratinized cells that have been pushed to the skin surface** 159
The Structure of Hair and Hair Follicles • Functions of Hair • Hair Color
- 5-7 Sebaceous glands and sweat glands are exocrine glands found in the skin** 162
Sebaceous (Oil) Glands • Sweat Glands

- 5-8 Nails are keratinized epidermal cells that protect the tips of fingers and toes 163
- 5-9 After an injury, the integument is repaired in several phases 164
Repair of Skin Injuries • Effects of Burns
- 5-10 Effects of aging include dermal thinning, wrinkling, and reduced melanocyte activity 167

SPOTLIGHT

The Epidermis 154

CLINICAL NOTES

Drug Administration through the Skin 155

Disorders of Keratin Production 156

Dermatitis 158

Hair Loss 161

Burns 166

Chapter Review 169

6 The Skeletal System 172

An Introduction to the Skeletal System 173

- 6-1 The skeletal system has five major functions 173
- 6-2 Bones are classified according to shape and structure 173
Macroscopic Features of Bone • Microscopic Features of Bone
- 6-3 Ossification and appositional growth are processes of bone formation and enlargement 176
Intramembranous Ossification • Endochondral Ossification • Bone Growth and Body Proportions • Requirements for Normal Bone Growth
- 6-4 Bone growth and development depend on a balance between bone formation and resorption, and on calcium availability 179
The Role of Remodeling in Support • The Skeleton as a Calcium Reserve • Repair of Fractures
- 6-5 Osteopenia has a widespread effect on aging skeletal tissue 182
- 6-6 The bones of the skeleton are distinguished by bone markings and grouped into two skeletal divisions 182
Bone Markings (Surface Features) • Skeletal Divisions
- 6-7 The bones of the skull, vertebral column, and thoracic cage make up the axial skeleton 186
The Skull • The Vertebral Column and Thoracic Cage
- 6-8 The pectoral girdles and upper limb bones, and the pelvic girdle and lower limb bones, make up the appendicular skeleton 196
The Pectoral Girdles • The Upper Limb • The Pelvic Girdle • The Lower Limb

- 6-9 Joints are categorized according to their range of motion or anatomical organization 204
Immovable Joints (Synarthroses) • Slightly Movable Joints (Amphiarthroses) • Freely Movable Joints (Diarthroses)

- 6-10 The structure and functions of synovial joints enable various skeletal movements 206
Types of Movements at Synovial Joints • Types of Synovial Joints

- 6-11 Intervertebral joints and appendicular joints demonstrate functional differences in support and mobility 209
Intervertebral Joints • Joints of the Upper Limb • Joints of the Lower Limb

- 6-12 The skeletal system supports and stores energy and minerals for other body systems 214

SPOTLIGHT

Synovial Joints 210

CLINICAL NOTES

Types of Fractures and Steps in Repair 180

Osteoporosis 182

Rheumatism and Arthritis 206

Hip Fractures 214

Chapter Review 216

7 The Muscular System 221

An Introduction to Muscle Tissue 222

- 7-1 Skeletal muscle performs five primary functions 222
- 7-2 A skeletal muscle contains muscle tissue, connective tissues, blood vessels, and nerves 222
Connective Tissue Organization • Blood Vessels and Nerves
- 7-3 Skeletal muscle fibers have distinctive features 224
The Sarcolemma and Transverse Tubules • Myofibrils • The Sarcoplasmic Reticulum • Sarcomeres
- 7-4 The nervous system and skeletal muscles communicate at neuromuscular junctions 227
The Neuromuscular Junction • The Contraction Cycle
- 7-5 Sarcomere shortening and muscle fiber stimulation produce tension 230
Frequency of Muscle Fiber Stimulation • Number of Muscle Fibers Activated • Isotonic and Isometric Contractions • Muscle Elongation Following Contraction
- 7-6 ATP is the energy source for muscle contraction 237
ATP and CP Reserves • ATP Generation • Energy Use and the Level of Muscle Activity • Muscle Fatigue • The Recovery Period

- 7-7** Muscle performance depends on muscle fiber type and physical conditioning 240
Types of Skeletal Muscle Fibers • Physical Conditioning
- 7-8** Cardiac and smooth muscle tissues differ in structure and function from skeletal muscle tissue 241
Cardiac Muscle Tissue • Smooth Muscle Tissue
- 7-9** Descriptive terms are used to name skeletal muscles 243
Origins, Insertions, and Actions • Names of Skeletal Muscles
- 7-10** Axial muscles are muscles of the head and neck, vertebral column, trunk, and pelvic floor 247
Muscles of the Head and Neck • Muscles of the Spine • The Axial Muscles of the Trunk • Muscles of the Pelvic Floor
- 7-11** Appendicular muscles are muscles of the shoulders, upper limbs, pelvic girdle, and lower limbs 255
Muscles of the Shoulders and Upper Limbs • Muscles of the Pelvis and Lower Limbs
- 7-12** The size and power of muscle tissue decrease with advancing age 266
- 7-13** Exercise produces responses in multiple body systems 267
- SPOTLIGHTS**
Events at the Neuromuscular Junction 228
The Contraction Cycle 232
- CLINICAL NOTES**
Interference at the NMJ and Muscular Paralysis 230
Rigor Mortis 230
Tetanus 231
Hernias 250
Intramuscular Injections 253

Chapter Review 269

8 The Nervous System 273

An Introduction to the Nervous System 274

- 8-1** The nervous system has anatomical and functional divisions 274
- 8-2** Neurons are specialized for intercellular communication and are supported by cells called neuroglia 275
Neurons • Neuroglia • Organization of Neurons in the Nervous System
- 8-3** In neurons, a change in the plasma membrane's electrical potential may result in an action potential (nerve impulse) 281
The Membrane Potential • Propagation of an Action Potential

- 8-4** At synapses, communication takes place among neurons or between neurons and other cells 288
Structure of a Synapse • Synaptic Function and Neurotransmitters • Neuronal Pools
- 8-5** The brain and spinal cord are surrounded by three layers of membranes called the meninges 291
The Dura Mater • The Arachnoid • The Pia Mater
- 8-6** The spinal cord contains gray matter surrounded by white matter and connects to 31 pairs of spinal nerves 292
Gross Anatomy • Sectional Anatomy
- 8-7** The brain has several principal structures, each with specific functions 296
The Major Regions of the Brain • The Ventricles of the Brain • The Cerebrum • The Diencephalon • The Midbrain • The Pons • The Cerebellum • The Medulla Oblongata
- 8-8** The PNS connects the CNS with the body's external and internal environments 308
The Cranial Nerves • The Spinal Nerves • Nerve Plexuses
- 8-9** Reflexes are rapid, automatic responses to stimuli 313
Simple Reflexes • Complex Reflexes • Integration and Control of Spinal Reflexes
- 8-10** Separate pathways carry sensory information and motor commands 316
Sensory Pathways • Motor Pathways
- 8-11** The autonomic nervous system, composed of the sympathetic and parasympathetic divisions, is involved in the unconscious regulation of body functions 319
The Sympathetic Division • The Parasympathetic Division • Relationships between the Sympathetic and Parasympathetic Divisions
- 8-12** Aging produces various structural and functional changes in the nervous system 324
- 8-13** The nervous system is closely integrated with other body systems 326

SPOTLIGHTS

- The Generation of an Action Potential 284
Propagation of an Action Potential 286

CLINICAL NOTES

- Demyelination Disorders 281
Epidural and Subdural Hemorrhages 292
Spinal Cord Injuries 294
Aphasia and Dyslexia 304
Seizures 305
Cerebral Palsy 319
Alzheimer's Disease 326

Chapter Review 328

9 The General and Special Senses 335

An Introduction to General and Special Senses 336

- 9-1** Sensory receptors connect our internal and external environments with the nervous system 336
- 9-2** General sensory receptors are classified by the type of stimulus that excites them 337
Pain • Temperature • Touch, Pressure, and Position • Chemical Detection
- 9-3** Olfaction, the sense of smell, involves olfactory receptors responding to chemical stimuli 341
The Olfactory Pathways
- 9-4** Gustation, the sense of taste, involves taste receptors responding to chemical stimuli 343
The Taste Pathways
- 9-5** Internal eye structures contribute to vision, while accessory eye structures provide protection 344
The Accessory Structures of the Eye • The Eye
- 9-6** Photoreceptors respond to light and change it into electrical signals essential to visual physiology 353
Rods and Cones • Photoreceptor Structure • Photoreception • The Visual Pathways
- 9-7** Equilibrium sensations originate within the internal ear, while hearing involves the detection and interpretation of sound waves 358
Anatomy of the Ear • Equilibrium • Hearing
- 9-8** Aging is accompanied by a noticeable decline in the special senses 368
Smell and Aging • Taste and Aging • Vision and Aging • Equilibrium and Aging • Hearing and Aging

SPOTLIGHT

Refractive Problems 354

CLINICAL NOTES

Cataracts 351
Visual Acuity 356
Night Blindness 357
Hearing Deficits 366

Chapter Review 369

10 The Endocrine System 374

An Introduction to the Endocrine System 375

- 10-1** Homeostasis is preserved through intercellular communication 375

- 10-2** The endocrine system regulates physiological processes through the binding of hormones to receptors 376
The Structure of Hormones • Hormone Action • The Secretion and Distribution of Hormones • The Control of Endocrine Activity
- 10-3** The bilobed pituitary gland is an endocrine organ that releases nine peptide hormones 381
The Anterior Lobe of the Pituitary Gland • The Posterior Lobe of the Pituitary Gland
- 10-4** The thyroid gland synthesizes thyroid hormones that affect the rate of metabolism 386
Thyroid Follicles and Thyroid Hormones • The C Cells of the Thyroid Gland and Calcitonin
- 10-5** The four parathyroid glands, embedded in the posterior surfaces of the thyroid gland, secrete parathyroid hormone to elevate blood calcium levels 390
- 10-6** The adrenal glands, consisting of a cortex and a medulla, cap each kidney and secrete several hormones 390
The Adrenal Cortex • The Adrenal Medulla
- 10-7** The pineal gland, attached to the third ventricle, secretes melatonin 393
- 10-8** The endocrine pancreas produces insulin and glucagon, hormones that regulate blood glucose levels 393
Diabetes Mellitus
- 10-9** Many organs have secondary endocrine functions 395
The Intestines • The Kidneys • The Heart • The Thymus • The Gonads • Adipose Tissue
- 10-10** Hormones interact to produce coordinated physiological responses 398
Hormones and Growth • Hormones and Stress • Hormones and Behavior • Hormones and Aging
- 10-11** Extensive integration occurs between the endocrine system and other body systems 403

SPOTLIGHT

The General Adaptation Syndrome 401

CLINICAL NOTES

Diabetes Insipidus 385
Diabetes Mellitus 396
Hormones and Athletic Performance 399
Endocrine Disorders 402

Chapter Review 405

11 The Cardiovascular System: Blood 409

An Introduction to the Cardiovascular System 410

- 11-1** Blood has several important functions and unique physical characteristics 410
Composition of Blood • Blood Collection and Analysis
- 11-2** Plasma, the fluid portion of blood, contains significant quantities of plasma proteins 411
Plasma Proteins
- 11-3** Red blood cells, formed by erythropoiesis, contain hemoglobin that can be recycled 414
Abundance of Red Blood Cells • Structure of RBCs • Hemoglobin Structure and Function • RBC Life Span and Circulation • RBC Formation
- 11-4** The ABO blood types and Rh system are based on antigen–antibody responses 420
Cross-Reactions in Transfusions • Testing for Blood Compatibility
- 11-5** The various types of white blood cells contribute to the body's defenses 423
WBC Circulation and Movement • Types of WBCs • The Differential Count and Changes in WBC Abundance • WBC Formation
- 11-6** Platelets, disc-shaped structures formed from megakaryocytes, function in the clotting process 427
- 11-7** Hemostasis involves vascular spasm, platelet plug formation, and blood coagulation 427
Phases of Hemostasis • The Clotting Process • Clot Retraction and Removal

SPOTLIGHT

The Composition of Whole Blood 412

CLINICAL NOTES

Abnormal Hemoglobin 416
Hemolytic Disease of the Newborn 422
Abnormal Hemostasis 429

Chapter Review 431

12 The Cardiovascular System: The Heart 434

The Heart's Role in the Cardiovascular System 435

- 12-1** The heart is a four-chambered organ, supplied by coronary circulation, that pumps oxygen-poor blood to the lungs and oxygen-rich blood to the rest of the body 435
The Surface Anatomy of the Heart • The Heart Wall • Internal Anatomy and Organization

12-2 Contractile cells and the conducting system produce each heartbeat, and an electrocardiogram records the associated electrical events 445
Contractile Cells • The Conducting System • The Electrocardiogram

12-3 Events during a complete heartbeat make up a cardiac cycle 450
Phases of the Cardiac Cycle • Heart Sounds

12-4 Heart dynamics examines the factors that affect cardiac output 452
Blood Volume Reflexes • Autonomic Innervation • Hormones

SPOTLIGHT

The Heart: Internal Anatomy and Blood Flow 441

CLINICAL NOTES

Heart Valve Disorders 442
Abnormal Conditions Affecting Cardiac Output 453

Chapter Review 455

13 The Cardiovascular System: Blood Vessels and Circulation 459

An Introduction to Blood Vessels and Circulation 460

- 13-1** Arteries, arterioles, capillaries, venules, and veins differ in size, structure, and function 460
The Structure of Vessel Walls • Arteries • Capillaries • Veins
- 13-2** Pressure and resistance determine blood flow and affect rates of capillary exchange 465
Factors Affecting Blood Flow • Cardiovascular Pressures within the Systemic Circuit
- 13-3** Cardiovascular regulation involves autoregulation, neural processes, and endocrine responses 471
Autoregulation of Blood Flow within Tissues • Neural Control of Blood Pressure and Blood Flow • Hormones and Cardiovascular Regulation
- 13-4** The cardiovascular system adapts to physiological stress 477
Exercise and the Cardiovascular System • The Cardiovascular Response to Hemorrhage
- 13-5** The pulmonary and systemic circuits of the cardiovascular system exhibit three general functional patterns 479
- 13-6** In the pulmonary circuit, deoxygenated blood enters the lungs in arteries, and oxygenated blood leaves the lungs in veins 480

13-7 The systemic circuit carries oxygenated blood from the left ventricle to tissues other than the lungs' exchange surfaces, and returns deoxygenated blood to the right atrium 481

Systemic Arteries • Systemic Veins

13-8 Modifications of fetal and maternal cardiovascular systems promote the exchange of materials until birth 492

Placental Blood Supply • Fetal Circulation in the Heart and Great Vessels • Circulatory Changes at Birth

13-9 Aging affects the blood, heart, and blood vessels 493

13-10 The cardiovascular system is both structurally and functionally linked to all other systems 494

SPOTLIGHT

Major Vessels of the Systemic Circuit 482

CLINICAL NOTES

Arteriosclerosis 463

Capillary Dynamics and Blood Volume and Pressure 469

Checking the Pulse and Blood Pressure 470

Exercise, Cardiovascular Fitness, and Health 477

Shock 478

Chapter Review 496

14 The Lymphatic System and Immunity 501

An Introduction to the Lymphatic System and Immunity 502

14-1 Anatomical barriers and defense processes make up nonspecific defense, and lymphocytes provide specific defense 502

14-2 Lymphatic vessels, lymphocytes, lymphoid tissues, and lymphoid organs function in body defenses 503

Functions of the Lymphatic System • Lymphatic Vessels • Lymphocytes • Lymphoid Tissues • Lymphoid Organs

14-3 Innate (nonspecific) defenses respond in a characteristic way regardless of the potential threat 511

Physical Barriers • Phagocytes • Immune Surveillance • Interferons • The Complement System • Inflammation • Fever

14-4 Adaptive (specific) defenses respond to specific threats and are either cell mediated or antibody mediated 515

Forms of Immunity • An Overview of Adaptive Immunity

14-5 T cells play a role in starting and controlling adaptive immunity 517

Antigen Presentation • T Cell Activation

14-6 B cells respond to antigens by producing specific antibodies 519

B Cell Sensitization and Activation • Antibody Structure • Antibody Function • Primary and Secondary Responses to Antigen Exposure • Summary of the Immune Response • Hormones of the Immune System

14-7 Abnormal immune responses result in immune disorders 526

Autoimmune Disorders • Immunodeficiency Diseases • Allergies

14-8 The immune response diminishes as we age 527

14-9 For all body systems, the lymphatic system provides defenses against infection and returns tissue fluid to the circulation 528

SPOTLIGHT

Origin and Distribution of Lymphocytes 507

CLINICAL NOTES

“Swollen Glands” 509

Injury to the Spleen 511

AIDS 523

Stress and the Immune Response 527

Manipulating the Immune Response 528

Chapter Review 530

15 The Respiratory System 535

An Introduction to the Respiratory System 536

15-1 The respiratory system, composed of air-conducting and respiratory portions, has several basic functions 536

Functions of the Respiratory System • Structures of the Respiratory System

15-2 The nose, pharynx, larynx, trachea, bronchi, and larger bronchioles conduct air into the lungs 538

The Nose • The Pharynx • The Larynx • The Trachea • The Bronchi

15-3 The smallest bronchioles and the alveoli within the lungs make up the respiratory portion of the respiratory tract 544

The Bronchioles • The Blood Air Barrier • The Lungs • The Pleural Cavities

15-4 External respiration and internal respiration allow gas exchange within the body 548

- 15-5** Pulmonary ventilation—the exchange of air between the atmosphere and the lungs—involves pressure changes and muscle movement 549
Pressure and Airflow to the Lungs • Compliance • Modes of Breathing • Lung Volumes and Capacities
- 15-6** Gas exchange depends on the partial pressures of gases and the diffusion of molecules 552
Mixed Gases and Partial Pressures • Partial Pressures in the Pulmonary and Systemic Circuits
- 15-7** In gas transport, most oxygen is transported bound to hemoglobin, whereas carbon dioxide is transported in three ways 554
Oxygen Transport • Carbon Dioxide Transport
- 15-8** Neurons in the medulla oblongata and pons, along with respiratory reflexes, control respiration 557
The Local Control of Respiration • Control by the Respiratory Centers of the Brain • The Reflex Control of Respiration • Control by Higher Centers • Respiratory Changes at Birth
- 15-9** Respiratory performance declines with age 562
- 15-10** The respiratory system provides oxygen to, and removes carbon dioxide from, other organ systems 562

SPOTLIGHTS

Pulmonary Ventilation 550

The Control of Respiration 560

CLINICAL NOTES

Cystic Fibrosis 539

Tracheal Blockage 542

Pneumonia 546

Tuberculosis 547

Decompression Sickness 553

Carbon Monoxide Poisoning 555

Emphysema and Lung Cancer 561

Chapter Review 564

16 The Digestive System 568

An Introduction to the Digestive System 569

- 16-1** The digestive system—the digestive tract and accessory organs—performs various food-processing functions 569
Functions of the Digestive System • Histological Organization of the Digestive Tract • The Movement of Digestive Materials
- 16-2** The oral cavity contains the tongue, salivary glands, and teeth, each with specific functions 573
The Tongue • Salivary Glands • Teeth

- 16-3** The pharynx is a passageway between the oral cavity and the esophagus 576
The Pharynx • The Esophagus • Swallowing
- 16-4** The J-shaped stomach receives food from the esophagus and aids in chemical and mechanical digestion 577
The Gastric Wall • The Regulation of Gastric Activity • Digestion in the Stomach
- 16-5** The small intestine chemically digests and absorbs nutrients 582
The Intestinal Wall • Intestinal Movements • Intestinal Secretions • Intestinal Hormones • Digestion in the Small Intestine
- 16-6** The pancreas, liver, and gallbladder are accessory organs that assist with chemical digestion in the small intestine 586
The Pancreas • The Liver • The Gallbladder
- 16-7** The large intestine is divided into three parts with regional specialization 592
The Cecum • The Colon • The Rectum • The Functions of the Large Intestine
- 16-8** Chemical digestion is the alteration of food that allows the absorption and use of nutrients 596
The Processing and Absorption of Nutrients • Water and Electrolyte Absorption • Absorption of Vitamins
- 16-9** Many age-related changes affect digestion and absorption 599
- 16-10** The digestive system is extensively integrated with other body systems 600

SPOTLIGHTS

Regulation of Gastric Activity 580

Chemical Events in Digestion 597

CLINICAL NOTES

Gastritis and Peptic Ulcers 581

Stomach Cancer 581

Vomiting 585

Pancreatitis 588

Liver Disease 591

Colorectal Cancer 594

Diverticulosis 595

Diarrhea and Constipation 595

Lactose Intolerance 598

Chapter Review 602

17 Metabolism and Energetics 607

An Introduction to Nutrition and Metabolism 608

- 17-1** Metabolism refers to all the chemical reactions in the body, and energetics refers to the flow and transformation of energy 608

- 17-2** Carbohydrate metabolism involves glycolysis, ATP production, and gluconeogenesis 610
Glycolysis • Energy Production Within Mitochondria • Energy Yield of Glycolysis and Cellular Respiration • Gluconeogenesis (Glucose Synthesis) • Alternate Catabolic Pathways
- 17-3** Lipid metabolism involves lipolysis, beta-oxidation, and the transport and distribution of lipids as lipoproteins and free fatty acids 617
Lipid Catabolism • Lipids and Energy Production • Lipid Synthesis • Lipid Transport and Distribution
- 17-4** Protein catabolism involves transamination and deamination, and protein synthesis involves amination and transamination 619
Amino Acid Catabolism • Amino Acids and Protein Synthesis
- 17-5** Nucleic acid catabolism involves RNA, but not DNA 621
RNA Catabolism • Nucleic Acid Synthesis
- 17-6** Adequate nutrition is necessary to prevent deficiency disorders and maintain homeostasis 622
Food Groups and a Balanced Diet • Minerals, Vitamins, and Water • Diet and Disease
- 17-7** Metabolic rate is the average caloric expenditure, and thermoregulation involves balancing heat-producing and heat-losing processes 626
The Energy Content of Food • Energy Expenditure: Metabolic Rate • Thermoregulation
- 17-8** Caloric needs decline with advancing age 629
SPOTLIGHT
Electron Transport Chain and ATP Formation 613
CLINICAL NOTES
Carbohydrate Loading 615
Dietary Fats and Cholesterol 617
Ketoacidosis 620
- Chapter Review** 630
- 18-3** Different portions of the nephron form urine by filtration, reabsorption, and secretion 643
Nephron Processes • Filtration at the Glomerulus • Reabsorption and Secretion along the Renal Tubule • Normal Urine
- 18-4** Normal kidney function depends on a stable GFR 650
The Local Regulation of Kidney Function • The Hormonal Control of Kidney Function
- 18-5** Urine is transported by the ureters, stored in the bladder, and eliminated through the urethra, aided by urinary reflexes 653
The Ureters • The Urinary Bladder • The Urethra • The Control of Urination
- 18-6** Fluid balance, electrolyte balance, and acid-base balance are interrelated and essential to homeostasis 656
The ECF and the ICF
- 18-7** Blood pressure and osmosis are involved in maintaining fluid and electrolyte balance 658
Fluid Balance • Electrolyte Balance
- 18-8** In acid-base balance, regulation of hydrogen ions in body fluids involves buffer systems and compensation by respiratory and renal processes 660
Acids in the Body • Buffers and Buffer Systems • Maintaining Acid-Base Balance • Acid-Base Disorders
- 18-9** Age-related changes affect kidney function and the control of urination 664
- 18-10** The urinary system is one of several body systems involved in waste excretion 665
SPOTLIGHT
A Summary of Kidney Function 648
CLINICAL NOTES
Kidney Failure 652
Urinary Tract Infections 654
Incontinence 655
Disturbances of Acid-Base Balance 663
- Chapter Review** 667

18 The Urinary System 634

An Introduction to the Urinary System 635

- 18-1** The urinary system—made up of the kidneys, ureters, urinary bladder, and urethra—has three major functions 635
- 18-2** The kidneys are highly vascular organs containing functional units called nephrons, which perform filtration, reabsorption, and secretion 636
Superficial and Sectional Anatomy of the Kidneys • The Blood Supply to the Kidneys • The Nephron

19 The Reproductive System 672

An Introduction to the Reproductive System 673

- 19-1** Basic reproductive system structures are gonads, ducts, accessory glands and organs, and external genitalia 673
- 19-2** Sperm formation (spermatogenesis) occurs in the testes, and hormones from the hypothalamus, pituitary gland, and testes control male reproductive functions 674
The Testes • Spermatogenesis • The Male Reproductive Tract • The Accessory Glands • The External Genitalia • Hormones and Male Reproductive Function

- 19-3** Ovum production (oogenesis) occurs in the ovaries, and hormones from the pituitary gland and ovaries control female reproductive functions 683
The Ovaries • The Uterine Tubes • The Uterus • The Vagina • The External Genitalia • The Mammary Glands • Hormones and the Female Reproductive Cycle
- 19-4** The autonomic nervous system influences male and female sexual function 695
Male Sexual Function • Female Sexual Function
- 19-5** With age, decreasing levels of reproductive hormones cause functional changes 696
Menopause • The Male Climacteric
- 19-6** The reproductive system secretes hormones affecting growth and metabolism of all body systems 697

SPOTLIGHTS

- Regulation of Male Reproduction 682
Regulation of Female Reproduction 692

CLINICAL NOTES

- Cryptorchidism 676
Prostatitis 680
Pelvic Inflammatory Disease (PID) 688
Amenorrhea 689
Breast Cancer 691
Infertility 694
Sexually Transmitted Diseases 695
Birth Control Strategies 698

Chapter Review 701

20 Development and Inheritance 705

An Introduction to Development and Inheritance 706

- 20-1** Development is a continuous process that occurs from fertilization to maturity 706
- 20-2** Fertilization—the fusion of a secondary oocyte and a sperm—forms a zygote 707
An Overview of Fertilization • Ovulation and Oocyte Activation
- 20-3** Gestation consists of three stages of prenatal development: the first, second, and third trimesters 709

- 20-4** Critical events of the first trimester are cleavage, implantation, placentation, and embryogenesis 709
Cleavage and Blastocyst Formation • Implantation • Placentation • Embryogenesis
- 20-5** During the second and third trimesters, maternal organ systems support the developing fetus, and the uterus undergoes structural and functional changes 717
The Effects of Pregnancy on Maternal Systems • Structural and Functional Changes in the Uterus
- 20-6** Labor consists of the dilation, expulsion, and placental stages 724
The Stages of Labor • Premature Labor • Multiple Births
- 20-7** Postnatal stages are the neonatal period, infancy, childhood, adolescence, and maturity, followed by senescence 726
The Neonatal Period, Infancy, and Childhood • Adolescence and Maturity
- 20-8** Genes and chromosomes determine patterns of inheritance 728
Patterns of Inheritance • The Human Genome

SPOTLIGHT

- Extra-Embryonic Membranes and Placenta Formation 714

CLINICAL NOTES

- Abortion 728
Chromosomal Abnormalities and Genetic Analysis 734

Chapter Review 735
